1	**(a)**	Explain how the students can minimise potential risks they might encounter when conducting their fieldwork in the two neighbourhoods shown in Resource 1.	[5]
		• Student can minimize potential risk to themselves by working in groups as they are in a foreign country, so they must always work in groups to look out for each other to call for help when there are potential danger such as being harassed by foreigners. • Students should also always stay on the side of the roads, especially in San'ya as it does not look like there are designated clear pathways between paths and roads so they need to look out for traffics when trying to conduct the survey or doing their environmental study. • Students can make sure they work in groups and have their mobile phone and always remain contactable, this is so that they can call for help if they get lost in San'ya or Sugamo. • They should also not venture into dark alleyways or enter places that look deserted as they are not familiar with the area and may encounter dangerous characters.	
	(b)	Using resource 1, explain how students can minimise potential ethical issues faced when conducting their fieldwork in both neighbourhoods.	[4]
		• They should not pressure or force the elderly to do their survey if they do not want to do it [1], ask them nicely and explain their intention of doing the survey or asking for their help with the environmental study [1]. • Do not ask sensitive questions such as name and age in their questionnaire survey [1] as these information may make the elderly feel uncomfortable [1] • Should not take photos that clearly show the faces of elderly without their permission [1], as this infringes on their personal privacy which will make them feel uncomfortable [1] and they do not know what the photos might be used for and where it will be published especially without their consent [1]. • When conducting the survey/environmental study, they should make sure not to disrupt businesses in Sugamo and San'ya such as standing right outside their shop [1] as these may deter other customers from going into the shops as they do not want to be asked to do surveys [1]	
	(c)	Describe an appropriate sampling method for the students to collect residents response on the residents' perception of quality of life in Sugamo and Sanya.	[6]
		• Appropriate sampling method would be stratified sampling [1] • Decide on sample size, need to be more than 30 respondents per neighborhood to be statistically significant [1] • Split elderly into men/women [1], different age groups such as 60-70, 70-80, 80 and above [1] • Can use secondary research to determine what is an ideal strata to divide [1] • Go to different parts of Sugamo and San'ya, check if they are residents in the district before getting them to engage in the questionnaire survey [1] • Go on different days and times to ensure it is more reliable and representative [1].	
	(d)	With reference to Resource 2, suggest two reasons why the environmental survey results differ between the residents and the students in Resource 3.	[4]
		• Subjectivity of the survey questions, what is considered good housing design may differ from students to elderly living there, such as in San'ya where students rate the housing design -3 but residents only rate it -1. Residents may also not want to rate their own neighborhood poorly as they stay there. [Accept similar logic of cultural difference and perception]	

- Students may not have enough understanding of the noise and traffic of different times of the day/year so their perception is only based on a particular time where they visit compared to the elderly residents who may have lived there for a long time and have a clearer understanding of the actual noise and traffic conditions.

[When non-response bias is accepted – that's why we always read the question fully first before we start- some of you wrote the same answer 3-4 times in the fieldwork- think and process]

- As seen from Resource 2, there is the option of '0' the residents may not want to rate their neighborhood badly compared to students, thus for certain issues they may choose '0' which is a neutral response which leads to non-response bias instead of the students who are more willing to rate and assess the environmental issue in Sugamo and Sanya.

(e) Sketch a suitable representation of the students' results for Sugamo and Sanya from Resource 3. [5]

(f) Suggest three potential limitations arising from the survey results from the residents' perception of quality of life in Sugamo and San'ya. [6]

- Residents may not understand English and did not fill up the survey properly, which affects the **reliability** of the data.
- Residents may have different perception or understanding of some of the survey questions used like community spirit/ or what is good or satisfactory can be subjective, affecting **accuracy** of the data.
- Small sample size of 25 residents is not representative, or only doing it within a week is not representative as other residents are not around, so not statistically significant **(not reliable)**.

	(g)	Evaluate the usefulness of Resources 1, 3 and 4 in helping students understand factors affecting liveability in Sugamo and San'ya and suggest which hypothesis should be accepted.	[10]

Either you do all the useful then not useful [Within each paragraph you point towards the hypothesis]
OR evaluate each resource → 3 paragraphs in total

The resources are useful to a small extent in understanding liveability in Sugamo and San'ya. Nevetheless, they support the hypothesis of group A.

Resource 1 is useful in understanding the environmental aspects of liveability in Sugamo and San'ya as it shows the streets of the area and the types of shops operating there, which gives an indication of the living environment and the amenities of the area. From Resource 1, we can see that it is more lively and crowded in Sugamo and the shops are operating with more people. Yet in Sugamo, many of the shops are shuttered and closed, and there is even a person laying on the street on the right of the photo, this might be indicative of the living environment having less amenities and might be less desirable to stay there. Thus, Resource 1, supports the notion that Sugamo is slightly more liveable than San'ya. However, Resource 1 is not useful in understanding the aspects of liveability as photograph is only indicative of what is taken at a point in time, the groups might have visited San'ya before the shops were opened and it might not be truly representative of the area. Also one photo cannot represent the amenities of the entire neighborhood.

Resource 3 is useful in further understanding the environmental aspects of liveability in Sugamo and San'ya. Students are able to compare the residents results and ranking of the environmental quality. We can see from Resource 3 that residents rate Sugamo higher than San'ya overall with a score of +5 than San'ya at -1. Although the scores differ from the residents, students themselves also rate Sugamo much higher at +9 compared to San'ya at -10. Nevertheless these support the notion that Sugamo has better environmental quality. However, Resource 3 is not useful because the ranking of many of these are very subjective as to what is considered a nice housing design, condition of building, or even noise and traffic is dependent on the time students were there. The large discrepancies in result with the residents may also further highlight issues of reliability with the student's results as only 8 of them did it compared to 25 residents.

Resource 4 is useful in reflecting the socio-economic aspects affecting liveability in Sugamo and San'ya. It shows how residents rate factors affecting social aspects of liveability like personal safety, community spirit and economic factors like the costs of necessities and health services which are important for the elderly. From Resource 4, it can be seen that the total scores of excellent and good in Sugamo is 58 which is much higher than San'ya at 33. This support that residents in Sugamo also have a better quality of life than San'ya in social and economic aspects which leans towards supporting the hypothesis of Group A stating that both environmental quality and quality of life in Sugamo is better than San'ya. However, the results may not be fully representative depending on the type of respondents the students chose to survey, what is considered high cost of necessities or health service would differ based on the income/wealth level of the respondents. What is considered an excellent park or playground and community spirit can also differ from respondents which affect the reliability of the results due to subjectivity of measurements. Similarly, for both results they only got it from 25 respondents which is not statistically significant enough due to the small sample size.

Nevertheless, in considering Resource 1, 3 and 4. They support Group A's hypothesis that Sugamo has better environmental quality and its residents have a higher quality of life than the residents of San'ya.

Cluster 3: Sustainable Future and Climate Change

2	Resource 5 shows the population growth of the world's 8 largest cities. Resource 6 shows the changes in Marina Bay Area, Singapore. Resource 7 shows the liveability city ranking for selected cities.		
	(a)	Using Resource 5, describe the change in urban population growth for the world's 8 largest cities from 1950 to 2035	[4]
		• All 8 cities experience an increase • Paris has the smallest increase from 1950 to 2035 by about 5 million people • Delhi is projected to have the largest increase and it will be the only city to be above 40 million people in 2035 • From 1950 to 2024, Tokyo had the largest increase of 25million • Mostly LDC cities increasing more	
	(b)	With reference to Resource 5, explain the forecasted UN Projection of the world's 8 largest cities in 2035.	[6]
		Reasons for urbanisation • Rural-Urban Migration in LDCs cities For some of the largest cities especially those in LDCs like Delhi, Dhaka, Mumbai, Lagos. Their rapid urbanization could be due to large scale rural urban migration [1] this is due to mechanization of agriculture and loss of jobs in rural areas forcing the rural population to move to urban areas to look for jobs opportunities [1] • Large scale natural increase in LDC Cities For the LDC cities Delhi, Dhaka, Mumbai, Lagos, the urban population increasing rapidly could also be due to large scale natural increase, as the cities develop there can be better nutrition and medical facilities, which leads to less death for infants/children. Thus with high fertility rate, and reduced death rates, there is a huge increase in the urban population • Popular attractive international migration in DC cities like Paris, Tokyo, New York- Newark For the DC cities like Tokyo, New York-Newark, Paris the increase in urban population could be because these places are also popular destination for international migration for better job opportunities as these places have high paying jobs and are considered very popular financial, cultural hubs. • Decline for Tokyo → Aging population and lower fertility rate Although the urban population for Tokyo was the highest in 2024, it was the only one that experience a decrease from 2025-2035, this could be due to aging population and lower fertility rate, with eventual elderly population and death and low fertility rate to replace the elderly population, eventually the urban population will start to decline.	
	(c)	Using Resource 6, describe the changes shown in the Marina Bay area.	[4]
		• Increase in building density • More infrastructure even on the bay (e.g. floating platform) or expansion and building into the bay • Less green spaces as they are replaced by buildings and iconic architecture • Increased construction of roads and bridges While it is commendable that you all name the places, floating platform, MBS, Helix bridge… its better to state where in the picture, because its not a requisite data and not the right keywords	

	(d)	Explain the economic reasons for cities to engage in urban reimaging efforts.	[6]
		Will elaborate a bit more here because this can morph into a 20m essay → evaluate the factors for urban reimaging (although syllabus just state economic factors) • Regenerate economy → transition from manufacturing to service sector: Regeneration of the economy is a main reason for urban reimaging, many DC cities that used to be manufacturing focused have suffered a decline due to deindustrialization and urban reimaging by changing the type of infrastructure may be to transition its economy from a manufacturing (secondary) sector to service (tertiary) sector. This can be seen in the case of the London Docklands, where the London docks were very run down and not viable and reimaging of flagship project like Canary Wharf was developed to transition it into a financial sector and office buildings. • Change undesirable urban image → Increase global competitiveness with adequate infrastructure to attract foreign direct investments in the form of TNCs investments. Similarly, urban reimaging occurs to change the undesirable urban image to make the cities look appealing for foreign TNCs to invest in it, this would then increase job opportunities and improve the economic vitality of the city. For instance, Beijing hosted the 2008 Olympics to showcase it has modern infrastructure and is capable of organizing a large scale global event, which showcased Beijing as a city and improved its global image bringing new investments and foreign TNCs to China. [Same for Singapore, hosting F1 night race, Youth Olympics Games – showing that we have very good infrastructure and airports, bringing in companies like Meta, Alphabet etc…] • Make city attractive for tourism by differentiating it from other cities. Cities also reimage and build Iconic architecture to differentiate itself from other cities, showing that it have special/unique draw for tourists to visit. [So we can use Singapore here- Gardens by the Bay, Marina Bay Sands/ Taipei 101/ Tokyo Tower/ Guggenheim Museum in Bilbao] Reason [1] + explanation of the reason with example [1]	
	(e)	Using Resource 7, describe the change in liveability ranking for selected cities.	[4]
		• Tokyo consistently remained as the most liveable city from 2013 to 2023 • Kyiv experienced the largest drop in liveability ranking from around 170 place in 2013 to 230 place in 2023 • Khartoum decreased in liveability ranking, but it was also the lowest ranked from 2013 to 2023 • Tbilisi have the largest increase in liveability ranking from 2013 to 2023	
	(f)	Explain the factors that could have led to a change in the liveability rankings for the cities shown in Resource 7.	[6]
		Social, Economic, Environmental, Political factors – either improve or regression • Social instability due to political conflict with Russia cause Kyiv to regress the most in liveability ranking from 2013 • Social/political instability and poor economy cause Khartoum in Sudan to always rank last • Strong economic conditions, good living environment cause Tokyo to always remain top Can read our past liveability factors 20m essay…	

Section B

Answer **either** Question 3 **or** Question 4

Cluster 3: Sustainable Future and Climate Change

3	Evaluate the extent to which we can measure Sustainable Urban Development.	[20]
	Students can discuss how SUD can be measured using single dimension and composite indicators and why are they important. Students can then discuss the flaws of measuring through such indicators and whether these flaws and issues can be overcome with more advance benchmarks like Bellagio Stamp.	
4	Evaluate the challenges in implementing strategies to respond to climate change.	[20]
	Students can discuss the various challenges for climate change such as political and economic challenges. Students can discuss how the main challenge may vary from country to country or students can discuss if the impact of climate change can also create uncertainty and confusion in trying to respond to climate change.	

[End of Paper]
